Example

Find the Fourier series for the function defined by

$$f(x) = -x \quad -\pi < x < 0$$

$$f(x) = 0 \quad 0 < x < \pi$$

$$f(x) = f(x + 2\pi)$$

The general expressions for a_0 , a_n , b_n are

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx, \quad a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx, \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx$$

$$\frac{1}{\pi} \int_{-\pi}^{\pi} 0 dx = \frac{1}{\pi} \int_{-\pi}^{\pi} 0 dx = 0$$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) dx + \frac{1}{\pi} \int_0^{\pi} 0 dx = \frac{1}{\pi} \left[-\frac{x^2}{2} \right]_{-\pi}^0 = \frac{1}{\pi} \left(0 - \left(-\frac{\pi^2}{2} \right) \right) = \frac{\pi}{2}$$

(b) To find a_n

$$\frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) \cos nx dx + \frac{1}{\pi} \int_0^{\pi} 0 \cos nx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \cos nx dx$$

$$= -\frac{1}{\pi} \left[\frac{x \sin nx}{n} - \frac{\cos nx}{n^2} \right]_{-\pi}^0 = -\frac{1}{\pi} \left(0 - \left(\frac{\pi \sin n\pi}{n} - \frac{\cos n\pi}{n^2} \right) \right) = \frac{1}{\pi n^2} \cos n\pi$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) \cos nx dx + \frac{1}{\pi} \int_0^{\pi} 0 \cos nx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \cos nx dx$$

$$\frac{1}{\pi} \int_{-\pi}^0 (-x) \cos nx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \cos nx dx$$

$$= -\frac{1}{\pi} \left[\frac{x \sin nx}{n} - \frac{\cos nx}{n^2} \right]_{-\pi}^0 = -\frac{1}{\pi} \left(0 - \left(\frac{-\pi \sin n\pi}{n} - \frac{\cos n\pi}{n^2} \right) \right) = \frac{1}{\pi n^2} \cos n\pi$$

$$= \frac{1}{\pi n^2} \cos n\pi = \frac{1}{\pi n^2} (-1)^n$$

$$= \frac{1}{\pi n^2} (-1)^n$$

$$= \frac{1}{\pi n^2} (-1)^n \text{ But } \cos n\pi = 1 \text{ (n even) and } \cos n\pi = -1 \text{ (n odd)}$$

(n odd) $a_n = -\frac{2}{n^2}$ (n odd) and $a_n = 0$ (n even)

(c) Now to find b_n

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) \sin nx \, dx = -\frac{1}{\pi} \int_0^{\pi} x \sin nx \, dx$$

$$\int_{-\pi}^{\pi}$$

$$\begin{aligned} & \left(\frac{-\cos nx}{n} \right) \Big|_{-\pi}^0 - \frac{1}{n} \int_{-\pi}^0 \cos nx \, dx \\ & \frac{1}{n} \left(\sin nx \right) \Big|_{-\pi}^0 - \frac{1}{n^2} \left(\cos nx \right) \Big|_{-\pi}^0 \\ & \left(\frac{x}{n} + \frac{\cos nx}{n^2} \right) \Big|_0^{\pi} = \frac{\pi}{n} - \frac{1}{n^2} \end{aligned}$$

So we have

(n even) and $b_n = -\frac{1}{n^2}$

(n odd)

$a_0 = \frac{\pi^2}{6}$; $a_n = 0$ (n even) and $a_n = -\frac{2}{n^2}$ (n odd)

$b_n = -\frac{1}{n^2}$ (n even) and $b_n = \frac{1}{n^2}$ (n odd)

(n odd)

$$f(x) = \frac{\pi^2}{6} - \frac{2}{n^2} \left(\frac{n^2}{1} - \frac{1}{n^2} \right)$$

$$\int_{-\pi}^{\pi}$$

$$\frac{1}{\pi} \int_{-\pi}^{\pi}$$

$$4\pi \left| \cos x + \frac{1}{9} \cos 3x + \frac{1}{25} \cos 5x + \dots \right| + \left| \sin x - \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x - \frac{1}{4} \sin 4x + \dots \right|$$

It is just a case of substituting $n = 1, 2, 3$, etc.

In this particular example, we have a constant term and both sine and cosine te

Example

Find the Fourier series for the function defined by

$$f(x) = -x \quad -\pi < x < 0$$

$$f(x) = 0 \quad 0 < x < \pi$$

$$f(x) = f(x + 2\pi)$$

The general expressions for a_0 , a_n , b_n are

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx, \quad a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx, \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx$$

$$\frac{1}{\pi} \int_{-\pi}^{\pi} \frac{1}{x^2} dx = \frac{1}{\pi} \left[-\frac{1}{x} \right]_{-\pi}^{\pi} = \frac{1}{\pi} \left(-\frac{1}{\pi} + \frac{1}{\pi} \right) = 0$$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) dx + \frac{1}{\pi} \int_0^{\pi} 0 dx = \frac{1}{\pi} \left[-\frac{x^2}{2} \right]_{-\pi}^0 = \frac{1}{\pi} \left(0 + \frac{\pi^2}{2} \right) = \frac{\pi}{2}$$

(b) To find a_n

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) \cos nx dx + \frac{1}{\pi} \int_0^{\pi} 0 \cos nx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \cos nx dx$$

$$= -\frac{1}{\pi} \left[\frac{x \sin nx}{n} - \frac{\cos nx}{n^2} \right]_{-\pi}^0 = -\frac{1}{\pi} \left(0 - \frac{\cos 0}{n^2} \right) = \frac{1}{\pi n^2}$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) \cos nx dx + \frac{1}{\pi} \int_0^{\pi} 0 \cos nx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \cos nx dx$$

$$= -\frac{1}{\pi} \left[\frac{x \sin nx}{n} - \frac{\cos nx}{n^2} \right]_{-\pi}^0 = -\frac{1}{\pi} \left(0 - \frac{\cos 0}{n^2} \right) = \frac{1}{\pi n^2}$$

$$\frac{1}{\pi} \int_{-\pi}^0 x \cos nx dx = \frac{1}{\pi} \left[\frac{x \sin nx}{n} - \frac{\cos nx}{n^2} \right]_{-\pi}^0 = \frac{1}{\pi} \left(0 - \frac{\cos 0}{n^2} \right) = -\frac{1}{\pi n^2}$$

$$= -\frac{1}{\pi n^2} \left[\cos 0 - \cos n\pi \right] = -\frac{1}{\pi n^2} [1 - \cos n\pi] = -\frac{1}{\pi n^2} [1 - (-1)^n]$$

$$a_n = \frac{1}{2} \{1 - \cos n\pi\}$$

But $\cos n\pi = 1$ (n even) and $\cos n\pi = -1$ (n odd)

$$a_n = \begin{cases} 0 & \text{(n even)} \\ 1 & \text{(n odd)} \end{cases}$$

(c) Now to find b_n

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \int_{-\pi}^0 (-x) \sin nx \, dx + \frac{1}{\pi} \int_0^{\pi} x \sin nx \, dx$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^0 -x \sin nx \, dx + \int_0^{\pi} x \sin nx \, dx \right]$$

$$= \frac{1}{\pi} \left[\left(\frac{x \cos nx}{n} + \frac{\sin nx}{n^2} \right) \Big|_{-\pi}^0 + \left(\frac{x \cos nx}{n} - \frac{\sin nx}{n^2} \right) \Big|_0^{\pi} \right]$$

$$= \frac{1}{\pi} \left[\left(\frac{0 \cdot \cos 0}{n} + \frac{\sin 0}{n^2} \right) - \left(\frac{-\pi \cos n\pi}{n} + \frac{\sin n\pi}{n^2} \right) + \left(\frac{\pi \cos n\pi}{n} - \frac{\sin n\pi}{n^2} \right) - \left(\frac{0 \cdot \cos 0}{n} - \frac{\sin 0}{n^2} \right) \right]$$

$$= \frac{1}{\pi} \left[\frac{\pi \cos n\pi}{n} + \frac{\pi \cos n\pi}{n} \right] = \frac{2 \cos n\pi}{n}$$

$$b_n = \frac{2 \cos n\pi}{n}$$

So we have

$$a_n = \begin{cases} 0 & \text{(n even)} \\ 1 & \text{(n odd)} \end{cases} \quad b_n = \frac{2 \cos n\pi}{n}$$

(n odd)

$$a_0 = 0; \quad a_n = 0 \text{ (n even) and } a_n = 1 \text{ (n odd)}$$

$$b_n = \frac{2 \cos n\pi}{n} \text{ (n even) and } b_n = \frac{2 \sin n\pi}{n} \text{ (n odd)}$$

(n odd)

$$f(x) = \frac{\pi}{2} - \frac{1}{n} \left(\frac{1}{1} - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots \right)$$

$$\frac{4\pi}{4x+\dots} \left(\cos x + \frac{1}{9} \cos 3x + \frac{1}{25} \cos 5x + \dots \right) + \left(\sin x - \frac{2}{9} \sin 3x + \frac{3}{25} \sin 5x - \dots \right)$$

It is just a case of substituting $n = 1, 2, 3$, etc.

In this particular example, we have a constant term and both sine and cosine terms.
