

Assignment (one point perspective)

.....Working with space in perspective

- One point perspective study

Exercise:- Create 3-D forms on a grid plane. Apply color values to support the illusion of space.

- Define vanishing point, horizon line, receding lines
- Use 1-pt. perspective to create a grid
- Render complex forms on a grid plane

this)

(You have to create an assignment like

Grid dimensions: 15 x 15 squares

Draw the front side of the grid and divide it into 15 segments.

Connect each marks on the line with the vanishing point.

"checkerboard" method.

Complete the grid using the

need to build in 1-point perspective

These are the shapes that you

the grid. You can shade them or outline lightly.

Position the shapes on

Build one form at a

time.

Draw vertical lines from each

shape's corner

Define the height of the form (you decide on the height)

Remember:

All vertical lines stay vertical

All horizontal lines stay horizontal

All lines, that show depth - go to the vanishing point

Draw all lines (corners) even if they are not visible

form.

Start with a simple block

If you placed it in the center of the grid - you will have two sides visible: the front and the top.

Remember: the front side is where you do all extra measurements and form changes.

front of the block.

Draw a cut-out on the

to the vanishing point

Connect all new corners

Where the back top corner line crosses the new receding lines - draw two vertical lines down to the other two receding lines.

with a horizontal line.

Connect the two points

The new form is done.

Now you can erase the construction lines.

Continue with the rest of the forms.

Outline all visible corners.

variety of color values - keep the values consistent.

Color the forms using a
